One of the most effective waste minimization programs that can be established is the active life-cycle management of hazardous materials before they become hazardous waste. The active life-cycle management program provides procedures that allows hazardous material users the option to extend the life of certain hazardous materials after their shelf life term has expired.

Consumer appliances such as televisions, computers, and monitors contain mercury, dangerous chemicals, and other harmful components. The existing literature on hazardous materials addresses the risks attached to specific materials and emphasizes compliance and personal protective equipment (PPE)—but not the life cycle management of the materials that represent the hazards. A logistics treatment of the subject is needed to understand the underlying supply chain management principles and apply solutions to reduce overall use of hazardous materials. Community and Organizational Planning A sections. Section I defines and classifies hazardous materials and covers the U.S. regulatory framework and standards governing the transport and use of such materials. Section II examines institutional and organizational program elements and provides guidelines for developing these programs to reduce liability and risk while lowering point-source pollution and total hazardous waste production. The logistics approach to hazardous materials yields exponential benefits in costs and the reduction or elimination of such materials. It limits organizational liability and, at the same time, reduces the costs associated with hazardous waste management and disposal. This book serves as an integrative reference offering a

This research effort developed a modification to the HAZMAT program so that the program could provide the user with the capability to generate an estimate during the concept exploration and design phases for the total costs associated with hazardous materials usage in a major weapon system. Using the HAZMAT database, a spreadsheet was developed which projects a cost for a weapon system based on its total surface area and the number of aircraft to be

produced by performing an analogy with a similar weapon system. The modification uses algorithm which are based on the hazardous material substances rather than processes which use hazardous materials. This enables the user to eliminate various substances entirely from the weapon system rather than trying to identify every process which uses a particular substance. The modification was identified to be the most efficient method of calculating an estimate during the early phases of the life cycle through in depth interviews and analysis of existing literature on the subject. The authors feel that the methods discovered in this thesis will provide insight for future revisions of

Completely revised and updated, Hazardous Materials Compliance for Public Research Organizations: A Case Study, Second Edition presents a case study of one university's policies and practices with regard to the procurement, use, storage and disposal of HAZMAT in the context of a changing internal structure and regulatory environment. The author's presentation is no-holds-barred, using interviews, archival documentation, and unobtrusive observations as a participant where the research institution was at times noncompliant with the new federal guidelines.
