TLC of the ASA you synthesize in lab will be compared with the TLCs of commercially prepared ASA, the salicylic acid starting material, caffeine, and an aspirin tablet. A commercially prepared aspirin tablet contains mostly ASA, but other components such as caffeine, buffers, and starch binding agents are also added. How much of an aspirin tablet is

ASPIRIN SYNTHESIS & ANALYSIS

In this experiment, a thin-layer chromatography (TLC) was used to determine the composition of different analgesic drugs which were Aspirin, Ibuprofen, Caffeine, Paracetamol, tea sample and an unknown substance. Chromatography takes advantage of the fact that different substances are partitioned between two phases.

Thin Layer Chromatography for Composition of Analgesics

In the case of this experiment, the compounds being tested using the TLC method are common analgesic (pain-relieving) drugs containing active ingredients including aspirin, acetaminophen, caffeine, and ibuprofen.

Thin-Layer Chromatography - Analysis of Analgesics — Adam Cap

Background. Thin layer chromatography (TLC) is used routinely in the laboratory to both monitor reactions and analyse the purity of samples. TLC is a type of adsorption chromatography, and the most common substrates used for the stationary phases in the lab, are silica (SiO_2) and alumina (Al_2O_3). It is recommended that you read the page on adsorption chromatography before doing this experiment.

reaction. TLC is a sensitive technique - microgram (0.000001 g) quantities can be analyzed by TLC - and it takes little time for an analysis (about 5-10 minutes). TLC consists of three steps - spotting, development, and visualization. Photographs of each step are shown on the course website.

Thin layer chromatography TLC

Thin layer chromatography is a useful means of quickly characterizing the main active ingredients of certain commercial analgesics containing aspirin, caffeine, acetaminophen, and ibuprofen when they do not have many other organic compounds in significant proportions.

Thin Layer Chromatography (TLC) is a solid-liquid technique in which the two phases are a solid (stationary phase) and a liquid (moving phase). Solids most commonly used in chromatography are silica gel ($\text{SiO}_2 \times \text{H}_2\text{O}$) and alumina ($\text{Al}_2\text{O}_3 \times \text{H}_2\text{O}$). Both of these adsorbents are polar, but alumina is more so.
